

Business Analysis & Valuation

Marico Ltd

DCF Valuation Study

Company Overview

Introduction

Marico Limited is one of India’s leading FMCG companies with a strong presence in beauty, wellness, and healthy foods. Founded in 1988 and headquartered in Mumbai, it operates iconic brands such as Parachute, Saffola, and Livon. The firm has been serving millions of households and is growing using digital platforms, modern trade, and e-commerce. Its product lines include Coconut Oil, Edible Oils, Value Added Hair Oils, Leave-in Hair Conditioners, Male Grooming, Packaged Foods, Skin Care, and Healthy Foods, and Fabric Care among others.

Business Presence

Marico operates in 25+ countries across India, Bangladesh, the Middle East, Africa, and Southeast Asia. It has deep distribution networks in both urban and rural India, strengthened by initiatives like Project SETU and rising modern-trade penetration. Bangladesh remains a key growth market and other foreign markets are steadily growing.

Key Products/Brands

Marico’s portfolio is built around trusted, household brands. It has a hair-oil business that is headed by Parachute and enriched oils under the Nihar and Hair and Care brands. Saffola brand of oils, oats, honey and soya products are some of the foods that are strongly growing. Male grooming products such as Set Wet and Livon also diversify the consumer base of Marico.

Product Wise Revenue Breakup

Share Price Performance

Global Economy

The global economy enters 2025–26 with slow but steady growth, supported by easing inflation, accommodative financial conditions, and an AI-led investment cycle in the United States. The world GDP is set to increase at an average of 2.8 percent with the U.S. still driving the world demand and technology-driven exports. In spite of the geopolitical tensions, the global economy has learned to work under such circumstances, and companies and financial systems have adapted to a higher level of uncertainty.

However, several risks remain significant. IMF evaluations indicate that the tariff rates in the U.S. have increased to the highest rates since the Great Depression which has increased the world prices and slowed trade. The economy of China is likely to decelerate to close to 4% growth due to tariff barriers, low domestic demand, and geopolitical tensions. The performance of many emerging markets is mixed because they are trying to cope with currency fluctuations, commodity volatility, and debt issues.

At the same time, the global trade framework is undergoing a structural reset as countries reconsider decades of deep integration and shift towards more secure and diversified supply chains. Monetary authorities are also keeping the level of right caution balancing between inflation control and the necessity to stimulate growth. Overall, 2025–26 is likely to experience moderate but uneven expansion, shaped by AI-driven investment, reconfigured supply chains, and geopolitical realignments.

Indian Economy

India vs Global GDP Growth %

Source: IMF, World Bank, RBI

India's GDP (US\$ Trillion)

Source: IMF, World Bank

Overview

India remains the fastest-growing major economy, supported by strong domestic demand, structural reforms, and overall macroeconomic stability. GDP growth for FY2024–25 is expected to range between 6.3% and 6.8%, and the services will remain the most growing sector at more than 7%. Manufacturing growth has been moderate but steady, backed by resilient domestic consumption. The growth environment has been enhanced by the emphasis of the government on infrastructure, digitalisation, and the ease of doing business.

Increasing rural incomes and improved agricultural production have helped the recovery because of the increasing consumption by the population in the private sector. Rural demand has stayed firm, while improving labour conditions in urban areas have added to overall momentum. With CPI easing to 1.54% in September 2025, the RBI was able to cut policy rates and adopt a more accommodative stance. These changes have enhanced the purchasing power and promoted an increase in the investment activity.

Looking ahead, GDP is expected to increase by 6.7 % in FY2026 and 6.8 % in FY2027, with the help of lower crude prices, a stable monetary policy, and increase in consumption by the rural and middle-class population. The economic momentum in India is also likely to be supported by fact that investment activity and policy support of manufacturing and infrastructure will improve. The medium-term outlook remains positive, driven by strong domestic demand, a vibrant services sector, and continued structural reforms that aim to boost productivity and long-term competitiveness.

Fast Moving Consumer Goods - India

Overview

The Indian FMCG market is entering a strong growth phase, rising from about US\$ 245 billion in 2024 to over US\$ 1.1 trillion by 2033. Rural India is also contributing as digital access expands. Growth is driven by rising incomes, rapid urbanisation, and a young population spending more on convenience and branded products. As a result, India is becoming one of the fastest-growing FMCG markets globally, attracting greater interest from international businesses.

In India, quick-commerce has changed the way people shop, with fast delivery now influencing everyday FMCG purchases. Meanwhile, consumers are shifting to healthier food, herbal personal care, and more regional and organic. Despite the fact that the industry has been struggling with issues such as the increase in input prices and stiff competition, the future of the industry is very optimistic.

FMCG companies are investing more, building capacity and are more differentiated. Retail chain is expanding, online shopping is expanding at a high rate, and businesses are spending a lot of money on innovation and distribution. All these structural changes put in place mean that India will continue to be one of the most vibrant and fastest growing FMCG markets in the next ten years.

Indian FMCG Market Size (USD billion)

FMCG Sub-Sector Classification in India

Food & Beverages

The Food & Beverages industry in India is at the core of the FMCG industry that is estimated to be worth USD 245.4 billion in 2024. Ready-to-eat food, dairy products, snacks, and soft drinks remain considerably strong with the increasing incomes and changes in lifestyles increasing daily consumption. With increment in income, consumption is projected to improve and the convenience-based buying will make the F&B segment expand steadily.

Personal Care / Beauty

The market of Indian beauty and personal care is at present estimated to be USD 28 billion (2024). With the increase in grooming awareness, a young consumer base, and digital retail penetration, the segment is expected to be increasing with a CAGR of approximately 5.6 (FY2025-FY2033). Online channels and D2C brands are driving penetration more quickly with increased access to Tier-2/3 cities, which means beauty and personal care is a high-growth and low-income-elastic category.

Home Care

In 2024, the Indian home care market is estimated to be USD 8.71 billion. The trend has led to demand growth because of the RISE in hygiene awareness, cleanliness frequency and the inclination towards branded liquid and packaged products. Home care is a stable and growing segment of the FMCG industry as domestic cleaning products are increasingly becoming a need-based purchase rather than a luxury item.

FMCG Sector Breakdown (India)

Source: IMARC India FMCG Market Report

Health Care

The entire healthcare services segment is not included in the FMCG but the OTC and wellness sub-category is a major sub-category of the consumer-health segment. As the demand of the supplements, OTC medicines, and preventive-health products increases, this category is becoming a significant element of the FMCG wallet and is backed up by the urbanisation and transition to preventive-health behaviour.

Marico Ltd – Growth Story

Healthy Lifestyle Shift

Indian consumers are increasingly choosing healthier food and cooking options. Marico is capturing this shift through Saffola edible oils, oats, honey, soya, and millet-based foods. These categories benefit from rising demand for preventive wellness and nutrition. This health-focused portfolio positions Marico at the centre of India’s growing wellness consumption trend.

Digital Consumer Acceleration

Consumer buying has shifted rapidly toward online, quick commerce, and social-led discovery. Marico has responded by building strong digital-first brands like Beardo, Just Herbs and Plix. These brands scale via e-commerce, influencer marketing and digital content ecosystems. As India’s digital adoption rises, Marico gains a structural edge in fast-changing consumer channels.

Beauty & Grooming Premiumisation

Indian consumers, especially young men, are spending more on grooming and premium personal care. Marico has leveraged this trend through Beardo, Just Herbs and Plix personal care. These brands cater to premium skincare, beard grooming, haircare and clean beauty trends. This shift captures rising aspirations and higher willingness to pay for premium-quality products.

India's Disposable Income - Per Capita (US\$ thousand)

Source: IBEF (India Brand Equity Foundation)

Distribution Upgrade

With modern trade, e-commerce and quick commerce growing fast, distribution is transforming. Marico is strengthening its reach through Project SETU, improving GT penetration and urban availability. This ensures Marico’s brands remain competitive across all retail touchpoints. Better availability + modern retail focus = stronger volume base for core & new categories.

Financials

Revenue

In FY2025, the company reported revenue of INR 10,831 crore, reflecting a CAGR of 4.4% and 8.25% over the past 3 and 5 years, respectively. The management is optimistic of the expansion of business in India, which is backed by good performance in branded coconut oil, edible oil and personal care segments. The optimism is fueled by the growth of household incomes, consumer spending, global expansion and growing preference to branded and premium products.

The Company has given Guidance of 14%. Analysts project the revenue in FY2026 to be about INR 12,200 crore, which is 13 % higher than the revenue of the current year. The firm is already experiencing high raw material prices, particularly of copra and palm oil, but it has planned on gradually increasing its product prices, strategically mix its portfolio and diversify its sourcing of raw materials to mitigate the effect.

Furthermore, Marico has initiated Project SETU to redesign its General Trade and Rural Distribution Network, and the aim is to enhance market coverage, partner profitability, and general efficiency of operations. Project SETU will see Marico increase its direct outlets by about 1 million outlets to 1.5 million outlets by FY27. The program was implemented in 11 states in the present calendar year.

Revenue Breakdown

Marico – International Revenue Mix

Channel-Wise Revenue Mix

Revenue Growth

Source: IBEF, Company Analysis

Financials

COGS

In FY2025, the gross margin of Marico declined by 50 bps to 50.3%, primarily due to the steep increase in the price of copra. The largest component of the raw material basket of Marico, Copra, was more expensive because of poor crop production and unseasonal rainfall in major areas. Despite this pressure, the company could contain the margin effect by making timely price increases, improved product mix, and targeted cost-efficiency initiatives in manufacturing and packaging.

The raw materials constitute about 85% of the total cost of goods sold and about 45% of revenue of Marico. In this, copra adds nearly 40 percent, rice bran oil approximately 18 percent and edible oils approximately 25%, all of which were volatile throughout the year due to global pricing patterns and fluctuations in import duties. With the improvement in supply conditions, the prices of copra will stabilize, and the pressure on the costs will be reduced in the next few quarters.

Marico has traditionally enjoyed a high gross margin range of 45-53% which has been higher than the Indian FMCG average of 52%, and emerging-market counterparts of approx. 48%. As inflation of raw materials starts to ease and the gains of previous price gains continue to run, margins will tend to rebound to 50 percent in the short term and slowly approach the global sector average of approximately 51.8%.

Gross Margin

COGS Expenses

Financials

SG&A Expenses

During FY2025, the company has reported an EBITDA margin of 19.7%, which is 130 bps lower than FY2024's EBITDA margin of 21.0%. The decline in margin was largely attributed to the rise in the prices of raw materials, particularly, copra and edible oil. The management has claimed that it will maintain operating costs at a low level and has provided an EBITDA margin forecast of approx. 22% going forward.

Based on our research, we found that SG&A expenses have historically been around 28–30% of revenue, and the three major costs — Employee Benefit Cost, Advertisement and Sales Promotion, and Freight and Distribution Expenses — together account for about 72% of total SG&A expenses. These are the main costs that are directly connected with sales and which influence the profitability of the company greatly.

Going ahead, we anticipate that total SG&A will be 31% of revenue because the company is incurring higher expenditure on advertising its new products like Value-Added Hair Oils (VAHO), Foods and Premium Personal Care products. Moreover, the Project SETU is also likely to increase freight and distribution costs because it will increase rural distribution and cover more than 1.5 million outlets across India.

Financials

Inventory Days

Marico has generally kept the inventory levels efficient, although the sudden increase in the prices of copra and edible oil in FY2025 caused a decrease of 7.6%. The management is now anticipating that inventories would normalize as Project SETU continues to build up General Trade and after the copra prices stabilize, the company will only keep a normal buffer. The growing mix of E-commerce and Modern Trade is improving overall inventory efficiency due to faster stock movement.

Looking ahead, inventory days are expected to gradually return toward historical norms. Projections indicate an increase from 43 to 46 days in FY2026 and FY2027, eventually stabilizing near the typical ~42-day cycle as raw material prices ease and distribution becomes more efficient.

Trade Receivables

In FY2025, trade receivables increased mainly due to longer credit cycles in General Trade channel, causing slight rise in debtor days. Management expects debtor days to remain stable, supported by disciplined collection practices. Nearly 40% of receivables were outstanding for less than 6 months and the company faces no significant credit risk due to its stringent credit policy and diversified base.

Historically, the company has maintained receivables at around 8% of revenue, supported by a receivable turnover of 14x and roughly 30 receivable days. While peers operate with tighter cycles of about 25 days, the Street expects Marico’s receivable profile to remain broadly stable, with consensus around 42 days.

Financials

Trade Payables

Marico’s trade payables have remained stable over the years, broadly tracking its COGS and revenue growth. Payable days have historically moved within the 86–120 day range, with a median of around 95 days. FY2024 saw a temporary increase due to higher raw-material inflation, but FY2025 normalized to about 100 days as input prices eased.

Peer companies typically operate with payables of nearly 140 days, which is higher than Marico’s historical range. Street estimates also suggest that payable levels will remain broadly flat. In the absence of specific management guidance—and based on our research—we assume payable days to remain stable at 105 days going forward.

Borrowings

Marico continues to operate with a low-debt balance sheet, with long-term debt at 0% and short-term borrowings used mainly for seasonal working-capital needs. Leverage ratios remain strong, with Debt to Equity at 0.10x, Debt to Capital at 0.08x, and Debt to Asset at 0.05x in FY25, reflecting a conservative capital structure.

Looking ahead, the company plans to keep leverage minimal and rely on internal accruals for strategic expansion. While short-term borrowings may continue for working-capital needs, overall debt is expected to remain low. We assume long-term debt will stay at 0%, and short-term borrowings will stabilize near 4% of revenue.

Borrowings

Valuation

Objective

The objective is to reach at the intrinsic value of Marico's stock. The analysis aims to assess the company's worth basis its ability to generate cash flows, future growth, and risk associated with the business. We have carefully considered management's guidance while performing this analysis.

Valuation Methodology

There are primarily three approaches in valuation (viz., Cost Approach, Market Approach, and Income Approach). For any valuation, all the approaches may not be relevant and therefore will not give a fair estimate of value. Hence, the approach most suitable for a specific business/company must be applied in the valuation exercise based on common practices.

The three approaches generally adopted in valuation areas are:

- Asset Approach: Net Asset Value Method.
- Market Approach: Comparable Companies Method And Comparable Transaction Method
- Income Approach: Discounted Cash Flow Method.

Asset Approach

Under this approach, the value of a business is measured as the difference between its assets and liabilities. It focuses on determining the net asset value from an equity valuation perspective.

$$\text{Net Assets} = \text{Total Assets} - \text{Total External Liabilities}.$$

The net asset value is also referred to as Total Equity.

Market Approach

Under this approach, we measure the value of the business of the company by applying the market multiples of listed companies that trade actively and possess attributes similar and comparable with the target company. This methodology is based on the principle that such market pricing takes place between informed buyers and informed sellers while considering all the relevant factors. Not all multiples apply to every company. Therefore, the relevant multiples should be chosen carefully and adjusted for differences between the comparable. For the valuation of Marico, we have chosen the EV/EBITDA multiple.

Income Approach

Under this approach, the Value of the business is derived by considering free cash flows, future growth, and weighted average cost of capital, which signifies risk.

There are four major steps in the Income Approach.

- Forecasting future cash flows for an explicit growth period.
- Discounting these cash flows to present value at the rate of return, which depicts the risk in realizing the future cash flows and expected growth.
- Calculation of the terminal value of free cash flows post-explicit growth period.
- Addition of the present value of terminal cash flows and future cash flows during the explicit forecast period.

Risk Free Rate

We have considered 4.35% as the risk-free rate in estimation of cost of equity of 7.19%. The risk-free rate of India is calculated by considering local currency 10 years government bond yield adjusted for default spread of India.

Asset Beta

We have estimated an asset beta range of 0.40 to 0.50, with a mid point of 0.45 based on observed median of 5-year monthly asset beta of benchmark listed companies adjusted for Blume effect.

Equity Risk Premium (ERP)

An ERP of 5.89% has been adopted based on US implied equity risk premium, relative equity volatility of ICE BofA Public Sector Issues Emerging Mkts Index, S&P Emerging BMI Index and country risk premium of India.

Cost of Debt

For the purpose of assessing the cost of debt, we have used country's risk-free rate, country's default spread and corporate default spread based on company's debt rating and interest coverage ratio

Small Size Premium

Empirically small size assets have exceeded the returns as compared to large sized asset. We have used the study on size premium conducted by Incwert which is based on difference between actual return and CAPM expected returns arranged in decile basis market capitalization of Indian companies.

Valuation Summary

Valuation Method	Enterprise Value (Cr.)	Equity Value (Cr.)	Value per Share (₹)	Market Price (₹)	Discount / Premium (₹)	Premium %
DCF – Perpetuity Growth	42,145	42,013	323	720	-397	-55%
DCF – Exit Multiple	1,10,355	1,10,223	848	720	128	18%

Investment Thesis — Why Marico Deserves Its Valuation

- Strong brand equity and market leadership across core categories.
- Consistent free-cash-flow generation supported by an asset-light model.
- Premiumisation and digital-first brands driving long-term margin expansion.
- Foods portfolio scaling rapidly, adding a new growth engine.
- Distribution upgrade (Project SETU) strengthening volume outlook.
- Stable international business contributing to earnings visibility.

Risks to Valuation

- Volatility in copra and vegetable oil prices impacting gross margins.
- Highly competitive intensity in value-added hair oils and personal care.
- Execution risks in profitably scaling digital-first brands.
- Dependence on rural recovery amid inflation-sensitive demand cycles.
- Category slowdown risks in discretionary or premium segments.

Catalysts for Future Re-Rating

- A meaningful recovery in gross margins driven by softer copra and edible oil prices could strengthen earnings momentum and support a higher valuation multiple.
- Faster scale-up of Foods, Premium Personal Care, and Digital-First brands would improve revenue mix quality and expand Marico’s long-term growth potential.
- Successful execution of Project SETU can revive General Trade growth, enhance market reach, and unlock additional volume opportunities.
- Stronger international growth in Bangladesh, MENA, and South Africa, may contribute to higher consolidated earnings consistency.
- Sustained improvement in cash flows, combined with disciplined capital allocation, can reinforce investor confidence and drive re-rating potential.

Acknowledgement

This valuation report on **Marico Ltd.** has been made possible through the support, guidance, and encouragement of several individuals and institutions.

I would like to express my heartfelt gratitude to **CA Parth Verma Sir** for his exceptional mentorship throughout this journey. His deep domain knowledge, insightful feedback, and commitment to teaching valuation techniques played a pivotal role in shaping the quality of this report.

I would also like to note that this valuation is prepared purely for educational purposes, and no financial or investment decisions should be based on it.

Lastly, I am grateful to everyone who supported and encouraged me throughout this learning journey. Thank you for taking the time to review this valuation report.

For feedback, queries, or collaboration or professional opportunities, please feel free to reach out at:
